Uncontrolled influx of formation fluids into the wellbore during drilling. Which material is most commonly used as a drilling fluid? Bentonite-based muds or water-based drilling fluids. What is the main function of a blowout preventer (BOP)? To control unexpected pressure surges and prevent blowouts during drilling operations. Which parameter is most critical in determining the porosity of a rock formation? The volume percentage of void spaces or pores within the rock. What does the term 'net pay' refer to in reservoir engineering? The thickness of the reservoir zone that contains economically producible hydrocarbons. Which process is used to convert heavy crude oil into lighter, more valuable products? Crude oil refining, including processes like catalytic cracking and distillation. Which safety measure is essential during well completion to prevent blowouts? Proper wellbore casing, cementing, and the use of blowout preventers (BOPs).
