The competition typically comprises a set of challenging problems that require innovative approaches beyond standard curriculum. In 2014, the problems spanned various topics, including algebra, geometry, number theory, and combinatorics.

The final round usually consists of a series of four to six problems, each demanding a deep understanding of mathematical principles and the ability to apply them in novel ways. The scoring emphasizes accuracy and originality, rewarding students who demonstrate elegant solutions and insightful reasoning.

Key Problems from the 2014 AMDM Final and Their Solutions

Understanding the core problems and their solutions from the 2014 final provides valuable insights into the exam's level of difficulty and the strategies necessary for success.

Problem 1: Algebraic Manipulation Challenge

Problem Statement:

Find all real numbers x satisfying the equation

$$\frac{x^2 - 4}{x - 2} = x + 2.$$

Analysis and Solution:

At first glance, the equation involves a rational expression, hinting at potential domain restrictions and algebraic simplifications.

Step-by-step solution:

- Identify restrictions:

The denominator $x - 2 \neq 0 \Rightarrow x \neq 2.$

- Simplify the numerator:

Note that $x^2 - 4 = (x - 2)(x + 2)$.

- Rewrite the original equation:

$$\frac{(x - 2)(x + 2)}{x - 2} = x + 2.$$

- Cancel common factors:

For $x \neq 2$,

$$x + 2 = x + 2.$$

- Determine solutions:

Since the cancellation is valid when $x \neq 2$, the equation holds for all real $x \neq 2$.

Check the excluded point:

At $x = 2$, the original denominator is zero, so $x = 2$ is not in the domain.

- Final answer:

Solution set: All real x such that $x \neq 2$.

Key takeaway:

This problem emphasizes recognizing algebraic factorizations and domain restrictions, a common theme in AMDM problems.

Problem 2: Geometry with Circles and Triangles

Problem Statement:

In triangle ABC , points D and E lie on sides AB and AC respectively. The circles centered at D and E , with radii equal to DE , intersect at points D and F . Prove

that $\angle D$, $\angle E$, and $\angle F$ are collinear.

Analysis and Solution:

This problem involves circle properties, congruence, and collinearity concepts.

Outline of the solution:

- Recognize that circles centered at $\angle D$ and $\angle E$ with radius $\angle DE$ are congruent and intersect at points $\angle D$, $\angle E$, and $\angle F$.
- By the intersecting chords theorem or circle properties, analyze the points and distances.
- Use the fact that $\angle D$ and $\angle E$ lie on $\angle AB$ and $\angle AC$, respectively, and that $\angle F$ lies on both circles.
- Show that $\angle D$, $\angle E$, and $\angle F$ lie on the same straight line through angle chasing and power of a point arguments.

Key conclusion:

The collinearity of $\angle D$, $\angle E$, and $\angle F$ follows from properties of intersecting circles and symmetry within the triangle, showcasing the importance of circle theorems in geometry problems.
