Electron Configuration Practice Problems With Answers

Electron configuration practice problems with answers are essential tools for students and chemistry enthusiasts aiming to master the principles of atomic structure and electron distribution in

atoms. Understanding how electrons are arranged around the nucleus of an atom is fundamental to grasping chemical properties, reactivity, and periodic trends. This article provides a comprehensive collection of practice problems with detailed solutions to help you enhance your understanding of electron configurations.

Understanding Electron Configuration

Before diving into practice problems, it's crucial to understand what electron configuration entails. Electron configuration describes the distribution of electrons among the atomic orbitals of an element. The arrangement follows specific rules:

- Aufbau Principle: Electrons fill orbitals starting from the lowest energy level to the highest.
- Pauli Exclusion Principle: Each orbital can hold a maximum of two electrons with opposite spins.
- Hund's Rule: Electrons will fill degenerate orbitals (orbitals of the same energy) singly before pairing.

The standard notation for electron configuration indicates the energy level, type of orbital, and number of electrons. For example, the electron configuration of oxygen (atomic number 8) is $1s^2 2s^2 2p^2$.

Basic Practice Problems with Answers

These problems are designed to test your fundamental understanding of electron configurations.

Problem 1: Write the electron configuration for the element Sodium (Na).

Solution:

- Atomic number of Sodium = 11
- Fill orbitals following the Aufbau principle:
- $1s^2$ (2 electrons)
- $2s^2$ (2 electrons)
- $2p^6$ (6 electrons)
- $3s^1$ (1 electron)

Electron configuration: $1s^2 2s^2 2p^6 3s^1$

Problem 2: Determine the electron configuration for the element Chlorine (Cl).

Solution:

- Atomic number of Chlorine = 17
- Filling order:
 - $1s^2$
 - $2s^2$
 - $2p^?$
 - $3s^2$
 - $3p^?$

Electron configuration: $1s^2 2s^2 2p^? 3s^2 3p^?$

Problem 3: Write the electron configuration for the noble gas Argon (Ar).

Solution:

- Atomic number of Argon = 18
- Electron configuration:
 - $1s^2 2s^2 2p^? 3s^2 3p^?$

Electron configuration: [Ar]

Advanced Practice Problems

Once you're comfortable with basic configurations, attempt these more challenging problems involving transition metals, ions, and excited states.

Problem 4: Write the electron configuration for the Fe^{2+} ion.

Solution:

- Iron (Fe) atomic number = 26
- Neutral Fe: [Ar] $3d^? 4s^2$
- For Fe^{2+} , two electrons are lost, typically from the 4s orbital first:
- Remove 2 electrons from $4s^2$
- Electron configuration:
 - [Ar] $3d^?$

Answer: [Ar] 3d?

Problem 5: Determine the electron configuration for the Neon (Ne) atom in an excited state where one electron is promoted to a higher energy level.

Solution:

- Neutral Neon (Ne): $1s^2 2s^2 2p^6$
- Excited state: one electron from 2p is promoted to 3s:
- $1s^2 2s^2 2p^5 3s^1$

Note: This is an excited state, not the ground state.

Problem 6: Write the ground-state electron configuration for Copper (Cu).

Solution:

- Atomic number = 29
- Fill orbitals:
- $1s^2$
- $2s^2$

- $3d^{10}$

Answer: [Ar] $3d^{10} 4s^1$

(Note: Copper is an exception to the Aufbau principle; it stabilizes with a full d-subshell and a single electron in 4s.)

Practice Problems for Ions and Transition Elements

These problems focus on ion electron configurations and transition metals, which often involve electron loss or gain.

Problem 7: Write the electron configuration of the Cl^- ion.

- Cl^- ion gains one electron:
- Electron configuration: $1s^2 2s^2 2p^6 3s^2 3p^6$ (same as Argon)

Answer: [Ar]

Problem 8: Determine the electron configuration for the Cu^+ ion.

Solution:

- Copper atom: [Ar] $3d^9 4s^1$
- Cu^+ loses one electron, usually from 4s:
- Electron configuration: [Ar] $3d^{10}$

Strategies for Solving Electron Configuration Problems

To efficiently solve these problems, follow these steps:

- Identify the atomic number to determine the total electrons.
- Use the Aufbau principle to fill orbitals from low to high energy.
- Account for ions by adding or removing electrons from the neutral atom's configuration.

Electron Configuration Practice Problems with Answers: A Comprehensive Guide for Mastering Atomic Structure

Understanding electron configurations is fundamental to mastering atomic chemistry. These configurations reveal how electrons are distributed among an atom's orbitals, influencing chemical behavior, reactivity, and periodic trends. To solidify this understanding, practicing a variety of problems with detailed solutions is essential. This guide provides an extensive collection of electron configuration practice problems with answers, designed to deepen your comprehension, improve problem-solving skills, and prepare you for exams or advanced studies.

Introduction to Electron Configurations

Before delving into practice problems, let's briefly review what electron configurations are and why they matter.

- Definition: Electron configuration describes the distribution of electrons in an atom's orbitals, following specific principles and rules.
- Principles and Rules:
 - Aufbau Principle: Electrons fill orbitals starting from the lowest energy level to higher.
 - Pauli Exclusion Principle: Each orbital can hold a maximum of two electrons with opposite spins.
 - Hund's Rule: Electrons occupy degenerate orbitals singly before pairing.
- Notation: Electron configurations are written by listing orbitals and the number of electrons in each, e.g., $1s^2 2s^2 2p^?$.

Basic Electron Configuration Practice Problems

These initial problems focus on straightforward configurations, ideal for beginners.

Problem 1: Write the electron configuration for Hydrogen (H).

Solution:

- Hydrogen has 1 electron.
- Fill orbitals starting from 1s: 1s orbital gets 2 electrons, but only 1 is needed.
- Electron configuration: $1s^1$

Problem 2: Write the electron configuration for Helium (He).

Solution:

- Helium has 2 electrons.
- Both occupy the 1s orbital: $1s^2$

Problem 3: Write the electron configuration for Lithium (Li).

Solution:

- Lithium has 3 electrons.
- Fill 1s: $1s^2$
- Remaining 1 electron goes into 2s: $2s^1$
- Final configuration: $1s^2 2s^1$

Problem 4: Write the electron configuration for Neon (Ne).

Solution:

- Neon has 10 electrons.
- Fill orbitals in order:
 - $1s^2$
 - $2s^2$
 - $2p^6$
- Configuration: $1s^2 2s^2 2p^6$

Intermediate Problems with Noble Gas Notation

Using noble gas shorthand simplifies electron configurations for larger atoms.

Problem 5: Write the electron configuration for Sodium (Na) using noble gas notation.

Solution:

- Sodium has 11 electrons.
- Noble gas before sodium: Neon (Ne), which has 10 electrons.
- Remaining electron: 1 in 3s orbital.
- Configuration: [Ne] 3s¹

Problem 6: Write the electron configuration for Chlorine (Cl).

Solution:

- Chlorine has 17 electrons.
- Noble gas before chlorine: Argon (Ar), with 18 electrons, but it's more than 17, so previous noble gas is Argon with 18 electrons.
- Wait, since 17 electrons, the noble gas with fewer electrons is Argon (18), but since Chlorine has fewer electrons than Argon, we use the previous noble gas, which is Neon (10).

Actually, for 17 electrons:

- Noble gas before 17 electrons: Neon (10).
- After Neon, fill 3s²: 2 electrons
- Then 3p?: 5 electrons
- Final configuration: [Ne] 3s² 3p⁵

Advanced Practice Problems: Transition Metals and Beyond

Transition metals and elements in the d-block have more complex configurations, often involving d and f orbitals.

Problem 7: Write the electron configuration for Iron (Fe).

Solution:

- Atomic number: 26

- Noble gas before Fe: Argon (Ar), 18 electrons
- Remaining electrons: 8
- Fill 4s first: $4s^2$
- Remaining: 6 electrons go into 3d: 3d?
- Configuration: [Ar] $4s^2$ 3d?

Problem 8: Write the electron configuration for Copper (Cu). (Note the special case)

Solution:

- Atomic number: 29
- Noble gas before Cu: Argon (Ar)
- Remaining electrons: 11
- Fill 4s: $4s^2$
- Fill 3d: 9 electrons (but due to stability, Cu's configuration is often written as $3d^{10}$ $4s^1$)
- Final configuration: [Ar] $3d^{10}$ $4s^1$

Note: Copper's electron configuration is an exception to the Aufbau principle because a completely filled d-subshell provides extra stability.

Problems on Writing Electron Configurations from Atomic Numbers

These problems test your ability to determine configurations based solely on atomic numbers.

Problem 9: Write the electron configuration for an atom with atomic number 35.

Solution:

- Atomic number: 35
- Noble gas before: Krypton (Kr), 36 electrons, but since 35 is less, go back to Argon (18).
- The configuration after Argon (18):
- $4s^2$: 2 electrons
- $3d^{10}$: 10 electrons
- $4p^3$: 3 electrons
- Therefore, configuration: [Ar] $3d^{10}$ $4p^3$

Problem 10: Electron configuration for an atom with atomic number 47.

Solution:

- Atomic number: 47
- Noble gas before: Silver (Ag) with 47 electrons, but for a noble gas, we look at Rhodium (Rh), which has 45, or Palladium (Pd) with 46.
- The most recent noble gas before 47 is Krypton (Kr, 36 electrons).
- Remaining electrons: 11
- Fill orbitals:
- $5s^1$ (since $47-36=11$, but note that 5s can hold 2 electrons)
- Actually, the configuration:
- $[Kr] 5s^1 4d^?$ (since $5s^2 4d^?$ would be for silver, but for 47, the configuration is $[Kr] 5s^1 4d^?$)
- Final configuration: $[Kr] 5s^1 4d^?$

Special Cases and Electron Configuration Exceptions

While most elements follow the Aufbau principle, some exhibit electron configurations that are exceptions due to stability considerations.

- Copper (Cu): $3d^1 4s^1$ instead of $3d^? 4s^2$.
- Chromium (Cr): $3d^? 4s^1$ instead of $3d^? 4s^2$.
- Molybdenum (Mo): $4d^? 5s^1$ instead of $4d^? 5s^2$.

Understanding these exceptions:

- They occur because half-filled and fully filled d subshells confer extra stability.
- These deviations are essential for understanding real atomic behavior and are often tested in exams.

Practice Problems with Multiple Choice Answers

Testing recognition and quick recall.

Problem 11: Which of the following is the correct electron configuration for Sulfur (S)? (Atomic number 16)

- a) $1s^2 2s^2 2p^?$

Answer: b) Manganese

Additional Tips for Electron Configuration Practice

- Use the Periodic Table: It provides clues about the configuration, especially the noble gas shorthand.

QuestionAnswer What is the electron configuration of a neutral oxygen atom (O)? The electron configuration of oxygen (atomic number 8) is $1s^2 2s^2 2p^?$. How do you write the electron configuration for a calcium ion (Ca^{2+})? Calcium (atomic number 20) neutral configuration is $1s^2 2s^2 2p^? 3s^2 3p^? 4s^2$. For Ca^{2+} , it loses 2 electrons from the 4s orbital, resulting in $1s^2 2s^2 2p^? 3s^2 3p^?$. What is the electron configuration of a nitrogen atom (N)? Nitrogen (atomic number 7) has the electron configuration $1s^2 2s^2 2p^3$. Determine the electron configuration of a potassium ion (K^+). Potassium (atomic number 19) neutral configuration is $1s^2 2s^2 2p^? 3s^2 3p^? 4s^1$. For K^+ , it loses one electron from the 4s orbital, resulting in $1s^2 2s^2 2p^? 3s^2 3p^?$. What is the electron configuration for a

sulfur atom (S)? Sulfur (atomic number 16) has the electron configuration $1s^2 2s^2 2p^6 3s^2 3p^2$. How can you determine the electron configuration of an element using the Aufbau principle? Use the Aufbau principle by filling orbitals in order of increasing energy (1s, 2s, 2p, 3s, etc.), adding electrons until reaching the element's atomic number, and noting the distribution of electrons among the orbitals. Why do transition metals often have similar electron configurations, and how does this affect their chemical properties? Transition metals have similar electron configurations because their d orbitals are being filled across the period, often resulting in similar valence electron configurations (e.g., $3d^x$ or $3d^y$). This leads to comparable chemical properties like variable oxidation states and catalytic behavior.
