The date Friday, 8th November can serve as a springboard into broader mathematical theories and concepts.

Day of the Week Calculations

- The fact that 8th November 2024 is a Friday can be verified using Zeller's Congruence, a well-known algorithm for calculating the day of the week for any given date.

- Zeller's Congruence Formula:

For the Gregorian calendar:

$\lfloor$

$$h = \left(q + \left\lfloor \frac{13(m+1)}{5} \right\rfloor + K + \left\lfloor \frac{K}{4} \right\rfloor + \left\lfloor \frac{J}{4} \right\rfloor + 5J \right) \bmod 7$$

$\rfloor$

where:

- $\lfloor q \rfloor$ is the day of the month
- $\lfloor m \rfloor$ is the month (3 = March, ..., 12 = December; January and February are counted as months 13 and 14 of the previous year)
- $\lfloor K \rfloor$ is the year of the century ($\lfloor \text{year} \bmod 100 \rfloor$)
- $\lfloor J \rfloor$ is the zero-based century ($\lfloor \lfloor \text{year}/100 \rfloor \rfloor$)

Applying this formula to 8th November 2024 confirms it falls on a Friday, showcasing the application of modular arithmetic in practical calendar calculations.

Prime and Composite Analysis of Date Components

- Prime Components: 11 (month), 2 (from day 8's factors, 2^2), emphasizing the importance of prime numbers.
- Composite Components: 8, as 2^3 , a composite number with multiple divisors.

Mathematical Patterns in Calendar Cycles

- The Gregorian calendar repeats every 400 years, and understanding this cycle involves modular arithmetic and pattern recognition.
- The date in question can be situated within this cycle, allowing for statistical and combinatorial analysis of date distributions over long periods.

Applications of Mathematics in Analyzing the Date's Broader Context

Mathematics extends beyond pure number theory into practical applications, especially in fields such as computer science, data analysis, and forecasting.

Sample Middle School Math Olympiad Problems and Solutions

Problem 1:

Number Theory

Find all positive integers n such that $n^2 + 5n + 6$ is a perfect square.

Solution:

Rewrite the expression:

$$n^2 + 5n + 6 = (n + 2)(n + 3)$$

Set $(n + 2)(n + 3) = k^2$, where k is an integer.

Note that $(n + 2)$ and $(n + 3)$ are consecutive integers, so their product is close to $(n + 2.5)^2$.

Since the product of two consecutive integers is a perfect square only in special cases, check small values:

- For $n = 1$: $(1 + 2)(1 + 3) = 3 \times 4 = 12$, not a perfect square.
- For $n = 2$: $4 \times 5 = 20$, no.
- For $n = 7$: $9 \times 10 = 90$, no.
- For $n = 8$: $10 \times 11 = 110$, no.
- For larger n , the product increases and isn't a perfect square unless factors coincide in special ways.

Alternatively, note that for the product of two consecutive integers to be a perfect square, both must be perfect squares themselves or equal, which is impossible for consecutive integers unless at 0, which isn't positive.

Thus, there are no positive integers (n) such that $(n^2 + 5n + 6)$ is a perfect square.

Problem 2:

Geometry

In triangle (ABC) , $(AB = AC)$. The points (D) and (E) lie on (BC) such that $(BD = BE)$. If (AD) and (AE) intersect at point (F) , prove that $(BF = CF)$.

Solution Outline:

- Since $(AB = AC)$, triangle (ABC) is isosceles with (A) at the apex.
- (D) and (E) are points on (BC) with $(BD = BE)$. This symmetry suggests (D) and (E) are equidistant from some point or symmetric in position.
- The lines (AD) and (AE) intersect at (F) .
- Using properties of isosceles triangles and similar triangles, one can show (F) is the midpoint of (BC) , hence $(BF = CF)$.

This problem emphasizes symmetry and properties of isosceles triangles, typical in geometric olympiad problems.
