Atoms of the same element with different neutron counts, leading to variations in atomic mass but

not chemical properties.

3. The Periodic Table

Organized in increasing atomic number, the periodic table arranges elements into periods (rows) and groups (columns) based on similar properties.

Key Features:

- Elements in the same group exhibit similar chemical behaviors.
- Metals, non-metals, and metalloids are distinguished by position.
- Trends such as atomic radius, electronegativity, ionization energy, and reactivity are predictable across periods and groups.

Chemical Bonding and Compounds

1. Types of Chemical Bonds

Understanding how atoms combine is crucial; the main types are:

- Ionic Bonds: Formed when electrons are transferred from one atom (usually a metal) to another (usually a non-metal), creating ions that attract each other. Example: Sodium chloride (NaCl).
- Covalent Bonds: Formed when atoms share electron pairs, common among non-metals. Example: Water (H₂O).
- Metallic Bonds: In metals, atoms share a 'sea' of delocalized electrons, contributing to properties like conductivity.

2. Molecules and Compounds

- Molecules: Two or more atoms bonded chemically. Diatomic molecules like O₂ and N₂ are common.
- Compounds: Substances formed from different elements in fixed ratios, exhibiting unique properties. For instance, carbon dioxide (CO₂) is different from its constituent elements.

Empirical and Molecular Formulas

- The empirical formula shows the simplest ratio of elements.

- The molecular formula indicates the actual number of atoms in a molecule.

Chemical Reactions and Equations

1. Types of Chemical Reactions

- Combustion: Rapid oxidation producing heat and light, e.g., burning hydrocarbons.
- Decomposition: Breakdown of a compound into simpler substances, often via heating.
- Displacement: One element replaces another in a compound.
- Acid-Base Reactions: Transfer of protons (H⁺), leading to neutralization.
- Precipitation: Formation of insoluble solids from solutions.

2. Balancing Chemical Equations

Ensuring conservation of mass, equations are balanced by adjusting coefficients. For example:

Unbalanced:

Balanced:

3. Stoichiometry

Calculating quantities involved in reactions, such as moles, mass, and volume, using molar ratios derived from balanced equations, is fundamental for practical chemistry.

Acids, Bases, and Salts

1. Acid-Base Theories

- Arrhenius Theory: Acids release H⁺ ions; bases release OH⁻ ions in aqueous solutions.
- Brønsted-Lowry Theory: Acids donate protons; bases accept protons.
- Lewis Theory: Acids accept electron pairs; bases donate electron pairs.

pH Scale

Range from 0 to 14, indicating acidity (7). pH is measured using indicators or pH meters.

2. Salts and Their Formation

Salts are formed when acids react with bases (neutralization). They consist of positive and negative ions. Examples include sodium sulfate (Na_2SO_4) and potassium nitrate (KNO_3).

Organic Chemistry Basics

1. Introduction to Organic Compounds

Organic chemistry studies carbon-containing compounds. Key features include:

- Covalent bonding
- Functional groups (e.g., hydroxyl, carboxyl, amino)

Common Organic Compounds:

- Alkanes (saturated hydrocarbons, e.g., methane)
- Alkenes (unsaturated hydrocarbons with double bonds)
