Unitary Method Problems for ICSE: A Comprehensive Guide

Understanding and mastering unitary method problems is crucial for students preparing for the ICSE (Indian Certificate of Secondary Education) exams. The unitary method is a fundamental mathematical technique used to solve problems related to ratios, proportions, speed, distance, time, and other quantities. This method simplifies complex problems by first calculating the value of a single unit and then using it to find the value of the required quantity. In this article, we will explore various aspects of unitary method problems for ICSE, offering tips, strategies, and example questions to help students excel in this topic.

What is the Unitary Method?

Definition

The unitary method involves finding the value of 1 unit of a quantity and then using this value to determine the total or related quantities. It is particularly useful when quantities are proportional.

Steps to Solve Unitary Method Problems

- Identify the given quantities and their values.
- Calculate the value of 1 unit by dividing the given quantity by its corresponding value.
- Use the value of 1 unit to find the required quantity by multiplying it with the relevant unit value.

Common Types of Unitary Method Problems in ICSE

1. Problems on Speed, Distance, and Time

These problems involve calculating one of the three quantities when the other two are known.

Example:

A car travels 240 km in 4 hours. Find its speed per hour.

Solution:

- Speed = Distance / Time = 240 km / 4 hours = 60 km/hour.

2. Problems on Ratios and Proportions

These problems require finding an unknown quantity in a ratio or proportion.

Example:

If 3 pens cost Rs. 45, what is the cost of 7 pens?

Solution:

- Cost of 1 pen = Rs. 45 / 3 = Rs. 15.
- Cost of 7 pens = 7 × Rs. 15 = Rs. 105.

3. Problems on Mixture and Alligation

These involve finding quantities or concentrations in mixtures using the unitary method.

Example:

A mixture contains 20 liters of a 30% acid solution. How much pure acid is present in the mixture?

Solution:

- Acid in 20 liters = 30% of 20 liters = $(30/100) \times 20 = 6$ liters.

4. Problems on Percentage and Profit & Loss

These problems involve calculating discounts, profit, or loss percentages based on known quantities.

Example:

A shopkeeper sells an article for Rs. 840, making a profit of 20%. Find the cost price.

Solution:

- Cost Price = Selling Price / (1 + Profit Percentage/100)
- Cost Price = Rs. 840 / (1 + 20/100) = Rs. 840 / 1.2 = Rs. 700.

Strategies to Solve Unitary Method Problems for ICSE

Understand the Question Carefully

Before starting calculations, read the problem thoroughly to identify the known quantities and what is required.

Break Down the Problem

Divide the problem into smaller parts. For example, if multiple quantities are involved, handle each separately before combining results.

Use Simple Ratios and Proportions

Maintain ratios and proportions clearly to avoid confusion, especially in problems involving mixtures, ratios, or percentages.

Double-Check Calculations

Always verify your calculations to prevent errors, especially in multi-step problems.

Practice Different Types of Problems

Regular practice with a variety of problems enhances problem-solving speed and accuracy.

Sample Unitary Method Problems for ICSE with Solutions

Problem 1: Speed and Distance

A cyclist covers 150 km in 5 hours. Find the speed per hour and then determine how long it would take to cover 300 km at the same speed.

Solution:

- Speed = Distance / Time = 150 km / 5 hours = 30 km/hour.
- Time to cover 300 km = Distance / Speed = 300 km / 30 km/hour = 10 hours.

Problem 2: Proportions in Cost Calculation

A 12-liter mixture contains 5 liters of alcohol. How much alcohol is in 20 liters of the same mixture?

Solution:

- Alcohol per liter = 5 liters / 12 liters.
- For 20 liters, alcohol = $(5 / 12) \times 20 = (5 \times 20) / 12 = 100 / 12 \approx 8.33$ liters.

Problem 3: Profit Calculation

A shop sells an article at Rs. 950, gaining a profit of 25%. Find the cost price.

Solution:

- Cost Price = Selling Price / $(1 + \text{Profit}/100)$ = Rs. 950 / 1.25 = Rs. 760.

Unitary Method Problems for ICSE: A Comprehensive Guide

The unitary method is a fundamental concept in mathematics, especially vital for students preparing

for ICSE (Indian Certificate of Secondary Education) examinations. It forms the backbone of solving a wide array of problems involving ratios, proportions, speed, distance, time, percentages, and more. Mastering the unitary method not only helps in solving numerical problems efficiently but also enhances logical thinking and problem-solving skills, which are crucial for scoring well in exams.

In this detailed guide, we will explore the concept of the unitary method comprehensively, delve into various types of problems, provide step-by-step solving strategies, and share tips to excel in ICSE examinations.

Understanding the Unitary Method

What is the Unitary Method?

The unitary method is a technique used to find the value of one unit from given data, and then use this value to find the required quantities. Essentially, it involves:

- Determining the value of 1 unit of a quantity.
- Using this value to find the value of multiple units or other related quantities.

Example:

If 5 apples cost ₹20, then the cost of 1 apple can be found using the unitary method:

$$\text{Cost of 1 apple} = ₹20 \div 5 = ₹4$$

Once the cost of 1 apple is known, the cost of any number of apples can be calculated easily.

Why is the Unitary Method Important for ICSE Students?

- It simplifies complex problems by breaking them down into manageable units.
- It is a versatile approach applicable to various topics like ratios, percentages, speed-distance-time, profit-loss, and more.
- It encourages logical reasoning and proportional thinking.
- It saves time during exams by reducing complex calculations to simple division or multiplication.

Steps for Solving Unitary Method Problems

- Identify the given data: Understand what quantities are given and what needs to be found.

- Find the value of 1 unit: Divide the known quantity by the number of units involved.
- Calculate the required quantity: Multiply the value of 1 unit by the number of units needed for the problem.

General formula:

$$\text{Required quantity} = \left(\frac{\text{Given quantity}}{\text{Number of units given}} \right) \times \text{Number of units needed}$$

Types of Unitary Method Problems for ICSE

The unitary method is applicable across various topics. Here, we classify common problem types and discuss strategies to solve them.

1. Problems involving Ratios and Proportions

Example:

If 3 pens cost ₹12, what will be the cost of 7 pens?

Solution steps:

- Find the cost of 1 pen: $₹12 \div 3 = ₹4$
- Find the cost of 7 pens: $₹4 \times 7 = ₹28$

2. Percentage Problems

Example:

A student scores 75 marks out of 100. What percentage did they score?

Solution:

- Find the value of 1 mark: $75 \div 100 = 0.75$
- To find percentage: $(\text{Marks obtained} / \text{Total marks}) \times 100 = (75/100) \times 100 = 75\%$

Alternatively, if a student scored 45 marks out of 60,

- Value of 1 mark: $45 \div 60 = 0.75$
- Percentage: $0.75 \times 100 = 75\%$

3. Speed, Distance, and Time Problems

Example:

A car travels 240 km in 4 hours. How much distance will it cover in 7 hours at the same speed?

Solution:

- Find the speed: $\text{Distance} \div \text{Time} = 240 \text{ km} \div 4 \text{ hrs} = 60 \text{ km/hr}$
- Find the distance in 7 hours: $\text{Speed} \times \text{Time} = 60 \text{ km/hr} \times 7 \text{ hrs} = 420 \text{ km}$

4. Profit and Loss Problems

Example:

A shopkeeper sells an article for ₹240, incurring a loss of 10%. Find the cost price.

Solution:

- Let the cost price be ₹x.
- Selling price (SP) = Cost price (CP) + Loss
- Since loss = 10%, SP = 90% of CP:

$$₹240 = 90\% \text{ of } ₹x$$

$$₹240 = (90/100) \times ₹x$$

$$₹x = ₹240 \div (90/100) = ₹240 \times (100/90) = ₹266.67$$

In-Depth Examples and Step-by-Step Solutions

Let's explore some diverse problems to deepen understanding.

Example 1: Finding the Cost of Multiple Items

Problem:

If 8 chairs cost ₹1600, what will be the cost of 15 chairs?

- Find the cost of 1 chair: $₹1600 \div 8 = ₹200$
- Find the cost of 15 chairs: $₹200 \times 15 = ₹3000$

Answer: ₹3000

Example 2: Percentage Increase/Decrease

Problem:

A jacket's price increases from ₹500 to ₹600. Find the percentage increase.

Solution:

- Find the increase: $₹600 - ₹500 = ₹100$
- Percentage increase = $(\text{Increase} / \text{Original price}) \times 100 = (₹100 / ₹500) \times 100 = 20\%$

Answer: 20% increase

Example 3: Speed and Time with Different Distances

Problem:

A cyclist covers 30 km in 2 hours. How long will it take to cover 75 km at the same speed?

Solution:

- Find the speed: $30 \text{ km} \div 2 \text{ hrs} = 15 \text{ km/hr}$
- Find the time for 75 km: $75 \text{ km} \div 15 \text{ km/hr} = 5 \text{ hours}$

Answer: 5 hours

Example 4: Profit Calculation

Problem:

A vendor sells an article for ₹500 and makes a profit of 25%. Find the cost price.

Solution:

- Selling price (SP) = ₹500
- Profit = 25%, so:

$$SP = 125\% \text{ of } CP$$

- Calculate CP:

$$CP = SP \div 125\% = ₹500 \div 1.25 = ₹400$$

Answer: ₹400
