Key Topics and Solutions in Managerial Accounting 14th Edition

Cost Behavior and Cost-Volume-Profit (CVP) Analysis

Understanding how costs behave is foundational. The exam may include questions on how to determine the contribution margin, break-even point, or target profit levels.

Solution Approach:

- Identify fixed and variable costs.
- Calculate contribution margin per unit:

$\text{Contribution Margin} = \text{Sales Price per Unit} - \text{Variable Cost per Unit}$

- Determine break-even point in units:

$\text{Break-even Units} = \text{Fixed Costs} / \text{Contribution Margin per Unit}$

- For target profit, adjust the formula:

$\text{Required Sales in Units} = (\text{Fixed Costs} + \text{Target Profit}) / \text{Contribution Margin per Unit}$

Budgeting and Variance Analysis

Budgeting involves preparing operational plans, while variance analysis compares budgeted figures with actual results to identify performance issues.

Solution Approach:

- Review standard costs and actual costs.
- Calculate variances:
 - Sales Variance: (Actual Sales - Budgeted Sales)
 - Cost Variances: (Actual Cost - Standard Cost) for materials, labor, overhead.
- Analyze variances to identify causes (favorable vs. unfavorable).

Job Order and Process Costing

These methods allocate costs to products or services.

Solution Approach:

- For job order costing:
 - Accumulate direct materials, direct labor, and manufacturing overhead per job.
 - Use job cost sheets to assign costs.

Advance Cost Accounting 401 Problems and Solutions

Cost accounting plays a vital role in helping organizations analyze and control their expenses, improve profitability, and make informed managerial decisions. As students and professionals delve into advanced topics like Cost Accounting 401, they often encounter complex problems that require a deep understanding of cost concepts, methodologies, and analytical techniques. This article aims to explore common Advance Cost Accounting 401 problems and solutions, providing clarity and practical approaches to tackle these challenges effectively.

Understanding the Scope of Cost Accounting 401

Before diving into specific problems, it's crucial to understand what Cost Accounting 401 entails. This advanced course covers topics such as:

- Cost classification and analysis
- Cost allocation and apportionment
- Marginal costing and contribution analysis
- Standard costing and variance analysis
- Budgeting and control
- Activity-based costing
- Joint and by-product costing
- Cost control in complex manufacturing environments

Students often face intricate problems involving these topics, especially when integrating multiple concepts into real-world scenarios.

Common Problems in Advance Cost Accounting 401

Below are some typical problems encountered by students and professionals, along with their solutions.

1. Cost Allocation and Apportionment

Problem:

A manufacturing company has two departments: Production and Administration. The total overhead costs are \$120,000. The following data is available:

Department	Direct Labour Hours	Overheads to be allocated
------------	---------------------	---------------------------

-----	-----	-----
-------	-------	-------

Production	10,000	\$80,000
------------	--------	----------

Administration	2,000	\$40,000
----------------	-------	----------

Allocate the overheads to each department accurately using the appropriate basis.

Solution:

Since overheads are to be allocated based on direct labour hours:

- Total direct labour hours = $10,000 + 2,000 = 12,000$ hours

- Overhead rate per labour hour = $\text{Total overheads} / \text{Total labour hours} = \$120,000 / 12,000 = \$10$ per hour

- Allocation:

- Production: $10,000 \text{ hours} \times \$10 = \$100,000$

- Administration: $2,000 \text{ hours} \times \$10 = \$20,000$

Note: The initial data suggests overheads are already categorized, but the problem emphasizes proper allocation based on the chosen basis.

2. Standard Costing and Variance Analysis

Problem:

A company sets the standard cost for 1 unit of product as follows:

- Direct materials: 2 kg @ \$5/kg = \$10
- Direct wages: 3 hours @ \$8/hour = \$24

During the period, the actual data are:

- Materials used: 2.2 kg per unit at \$5.50/kg
- Labour hours: 3.2 hours per unit at \$8.50/hour
- Actual units produced: 1,000 units

Calculate the materials and labour variances.

Solution:

Materials Variances:

- Material Price Variance (MPV):

= (Actual Price - Standard Price) × Actual Quantity

= (\$5.50 - \$5.00) × (2.2 kg × 1,000 units)

= \$0.50 × 2,200 kg = \$1,100 Unfavorable

- Material Usage Variance (MUV):

= (Actual Quantity - Standard Quantity) × Standard Price

= (2.2 kg - 2 kg) × \$5 × 1,000 units

$$= 0.2 \text{ kg} \times \$5 \times 1,000 = \$1,000 \text{ Unfavorable}$$

Labour Variances:

- Wage Rate Variance (WRV):

$$= (\text{Actual Rate} - \text{Standard Rate}) \times \text{Actual Hours}$$

$$= (\$8.50 - \$8) \times (3.2 \text{ hours} \times 1,000 \text{ units})$$

$$= \$0.50 \times 3,200 \text{ hours} = \$1,600 \text{ Unfavorable}$$

- Labour Efficiency Variance (LEV):

$$= (\text{Actual Hours} - \text{Standard Hours}) \times \text{Standard Rate}$$

$$= (3.2 \text{ hours} - 3 \text{ hours}) \times \$8 \times 1,000 \text{ units}$$

$$= 0.2 \text{ hours} \times \$8 \times 1,000 = \$1,600 \text{ Unfavorable}$$

3. Marginal Costing and Break-even Analysis

Problem:

A firm produces a product with the following data:

- Selling Price per unit: \$50
- Variable Cost per unit: \$30
- Fixed Costs: \$100,000

Calculate the break-even point in units and sales value.

Solution:

- Contribution per unit:

$$= \text{Selling Price} - \text{Variable Cost} = \$50 - \$30 = \$20$$

- Break-even point (units):

= Fixed Costs / Contribution per unit = \$100,000 / \$20 = 5,000 units

- Break-even sales value:

= Break-even units × Selling price = 5,000 × \$50 = \$250,000

This analysis helps managers understand the sales volume needed to cover all costs.

4. Activity-Based Costing (ABC) Problems

Problem:

A company allocates overheads using ABC. The following data is available:

Cost Pool	Total Overheads	Cost Drivers	Total Driver Units
Machine setups	\$60,000	Number of setups	300
Quality inspections	\$40,000	Number of inspections	200

Products:

Product	Number of setups	Number of inspections	Units produced
A	150	80	1,000
B	150	120	2,000

Calculate the overhead cost per unit for each product.

Solution:

- Setup cost per setup:

$$= \$60,000 / 300 = \$200 \text{ per setup}$$

- Inspection cost per inspection:

$$= \$40,000 / 200 = \$200 \text{ per inspection}$$

- Total overhead allocated to each product:

- Product A:

$$\text{Overhead from setups: } 150 \text{ setups} \times \$200 = \$30,000$$

$$\text{Overhead from inspections: } 80 \text{ inspections} \times \$200 = \$16,000$$

$$\text{Total overhead: } \$46,000$$

- Product B:

$$\text{Overhead from setups: } 150 \text{ setups} \times \$200 = \$30,000$$

$$\text{Overhead from inspections: } 120 \text{ inspections} \times \$200 = \$24,000$$

$$\text{Total overhead: } \$54,000$$

- Overhead per unit:

- Product A:

$$= \$46,000 / 1,000 \text{ units} = \$46 \text{ per unit}$$

- Product B:

$$= \$54,000 / 2,000 \text{ units} = \$27 \text{ per unit}$$

This detailed allocation helps in accurate product costing and pricing decisions.

Selling price per unit = \$50

Variable cost per unit = \$30

Contribution margin per unit = \$50 - \$30 = \$20

- Determine Break-Even Units:

Break-even units = Fixed costs / Contribution margin per unit

= \$120,000 / \$20 = 6,000 units

- Calculate Break-Even Sales in Dollars:

Break-even sales = Break-even units selling price

= 6,000 \$50 = \$300,000

Key Takeaway:

This exercise demonstrates how to derive critical sales targets necessary to cover all costs, a

fundamental aspect of managerial decision-making.

Exercise Example 2: Budget Variance Analysis

Problem Summary:

A company prepared a flexible budget for 10,000 units, estimating direct material costs at \$5 per unit. Actual production was 10,200 units, with actual material costs totaling \$52,500. Find the materials cost variance and interpret its implications.

Solution Breakdown:

- Calculate Standard Material Cost for Actual Production:

Standard cost = Standard per unit Actual units

$$= \$5 \ 10,200 = \$51,000$$

- Determine Variance:

Variance = Actual cost - Standard cost

$$= \$52,500 - \$51,000 = \$1,500 \text{ unfavorable}$$

- Interpretation:

An unfavorable variance indicates higher than expected material costs, prompting review of supplier prices, wastage, or procurement efficiency.

Learning Point:

Variance analysis helps managers identify deviations and implement corrective actions promptly.

Exercise Example 3: Activity-Based Costing (ABC)

Problem Summary:

A company incurs overhead costs of \$200,000, allocated across two activities: Machine Setup

(costs \$120,000) and Quality Inspection (costs \$80,000). The activities serve two products with different consumption patterns. Product A requires 30 setups and 50 inspections; Product B requires 20 setups and 20 inspections.

Solution Approach:

- Calculate Activity Rates:

- Setup rate = Total setup cost / Total setups = $\$120,000 / (30 + 20) = \$120,000 / 50 = \$2,400$ per setup

- Inspection rate = $\$80,000 / (50 + 20) = \$80,000 / 70 = \$1,143$ per inspection

- Assign Overhead to Products:

- Product A: $(30 \text{ setups } \$2,400) + (50 \text{ inspections } \$1,143) = \$72,000 + \$57,150 = \$129,150$

- Product B: $(20 \text{ setups } \$2,400) + (20 \text{ inspections } \$1,143) = \$48,000 + \$22,860 = \$70,860$

- Insights:

ABC provides a more accurate cost allocation, enabling better pricing and product mix decisions.

Significance:

This exercise underscores the importance of activity-based costing in complex manufacturing environments for precise cost management.
