The goal is to facilitate efficient, reliable, and secure data exchange between distributed systems. In the context of Anna University's MC9241 course, network programming focuses primarily on socket programming, which is the foundation for most networked applications.

Socket Programming Explained

Sockets serve as endpoints for sending and receiving data across a network. They provide a programming interface that allows developers to implement communication protocols at the application level. Socket programming can be performed in various languages, with C and Java being prominent choices in university courses.

Types of Sockets

- **Stream Sockets (TCP):** Provide reliable, connection-oriented communication. Suitable for

applications requiring guaranteed data delivery, such as web browsing and email.
