- Enable bank switching to access additional memory banks.
- Generate chip select signals for memory chips.

Step 5: Develop Video Signal Generation

Design circuitry for:

- Generating synchronization signals (HSYNC and VSYNC).
- Accessing video RAM during display cycles.
- Converting video data into pixel signals or signals compatible with a display device.
- Handling border colors and screen layout.

Step 6: Integrate I/O Interfaces

Implement:

- Keyboard scanning circuitry, possibly using a matrix scan method.
- Output controls for sound, lights, or other peripherals.
- Input/output ports for communication.

Step 7: Generate System Timing and Interrupts

Design timing logic that:

- Coordinates read/write cycles with display refresh.
- Manages system interrupts for keyboard input or other events.
- Produces clock signals for system components.

Step 8: Prototype and Testing

- Assemble the logic design on a breadboard or FPGA development board.
- Write test routines to validate memory access, graphics rendering, and I/O.
- Debug timing issues and optimize logic pathways.

Practical Considerations and Tips

- Simulation First: Use digital design simulation tools (like ModelSim or Logisim) to validate logic before hardware implementation.
- Modular Design: Break down the ULA functions into modules or blocks for easier troubleshooting.
- Component Selection: Use readily available logic ICs for prototyping, but consider FPGA for more complex logic.
- Timing Constraints: Pay close attention to clock speeds and signal propagation delays to prevent glitches.
- Community Resources: Leverage existing designs and forums focused on ZX Spectrum hardware for insights and troubleshooting.

Example Block Diagram of a ZX Spectrum-Like ULA

While not a diagram here, envision a block diagram with the following interconnected modules:

- Memory Controller: Handles address decoding, bank switching, and memory access.
- Video Generator: Retrieves video RAM data, generates sync signals, and outputs pixel data.
- I/O Controller: Manages keyboard scanning, peripheral interfaces.
- Timing Generator: Creates system clock, sync signals, and manages interrupt requests.
- System Bus Interface: Connects the ULA to the CPU or microcontroller core.
