imshow(gray_img);

title('Grayscale Image');

```
```

This prepares images for many processing tasks that work better in single channels.

3. Histogram Equalization for Contrast Enhancement

```
```octave

% Apply histogram equalization

eq_img = histeq(gray_img);

Cons:

- Limited control over metadata.
- No built-in GUI for preview (though functions like `imshow()` can assist).

Image Display and Visualization

Visualization is crucial for understanding image data. Octave provides:

- `imshow()`: Display image in a figure window.
- `imagesc()`: Scales image data and displays it with color mapping.
- `imtool()`: An interactive image viewer (requires the image package).

Example:

```
```octave
```

```
imshow(img);
```

```
title('Original Image');
```

```
```
```

Pros:

- Easy to use.
- Supports multiple visualization options.

Cons:

- Limited interactivity compared to MATLAB's `imshow()`.

Color Space Conversion

Exercises often involve converting images between color spaces:

- RGB to Grayscale
- RGB to HSV
- Extracting individual color channels

Sample code to convert RGB to Grayscale:

```
```octave

gray_img = rgb2gray(img);

imshow(gray_img);

```
```

Pros:

- Facilitates tasks like thresholding and segmentation.
- Simple to implement.

Cons:

Filtering and Enhancement Techniques

Filtering operations help in noise reduction and feature enhancement.

Smoothing Filters

- Average Filter: Uses a kernel to replace each pixel with the average of its neighbors.
- Gaussian Filter: Applies a Gaussian kernel for smooth blurring.

Code snippet for Gaussian filtering:

```
```octave  

h = fspecial('gaussian', [5 5], 1.0);

smoothed_img = imfilter(img, h);

imshow(smoothed_img);

```
```

Pros:

- Reduces noise effectively.
- Preserves overall image structure.

- Can blur important details if overapplied.

Edge Detection

Edge detection emphasizes boundaries within images:

- Prewitt, Sobel, Canny: Common algorithms.
- Octave Implementation:

```
```octave  

edges = edge(gray_img, 'canny');

imshow(edges);

```
```

Pros:

- Detects object boundaries.
- Widely used in segmentation.

Cons:

- Sensitive to noise; may require preprocessing.

Morphological Operations

Morphology manipulates the geometrical structure of objects within images, primarily on binary images.

Common operations include:

- Dilation
- Erosion
- Opening and Closing

Sample code:

```
```octave

se = strel('disk', 5);

dilated_img = imdilate(binary_img, se);

imshow(dilated_img);

```
```

Pros:

- Useful for noise removal, object separation.
- Simple to implement.

Image Segmentation and Thresholding

Segmentation partitions an image into meaningful regions.

Global Thresholding:

```
```octave  

level = graythresh(gray_img);

bw = imbinarize(gray_img, level);

imshow(bw);

```
```

Advanced Techniques:

- K-means clustering
- Watershed segmentation

Pros:

- Facilitates object recognition.
- Can be automated.

Cons:

- Sensitive to noise.
- May require parameter tuning.

Feature Extraction and Analysis

After segmentation, exercises often involve extracting features such as:

- Area
- Perimeter
- Shape descriptors

Sample:

```
```octave
```

```
stats = regionprops(bw, 'Area', 'Perimeter');
```

```
```
```

Pros:

- Enables quantitative analysis.
