- To calculate probabilities in various contexts
- To interpret probability models and outcomes
- To develop problem-solving skills related to probability scenarios

Core Concepts Covered

- Sample spaces and events
- Calculating probability of single and multiple events
- Compound events and the use of probability rules
- Independent and dependent events
- Conditional probability
- Using tree diagrams and Venn diagrams to visualize probability problems
- Law of large numbers and expected value

Key Sections of the Probability Review

1. Basic Probability Calculations

This section introduces the fundamental formula:

\[

$$P(E) = \frac{\text{Number of favorable outcomes}}{\text{Total number of outcomes}}$$

\]

Students learn to identify sample spaces, define events, and compute probabilities accordingly. The answer key provides step-by-step solutions, clarifying common pitfalls such as not properly counting outcomes or misunderstanding the event definitions.

2. Experimental vs. Theoretical Probability

- Theoretical probability involves calculations based on known possible outcomes assuming equally likely events.
- Experimental probability is based on actual experimental data or trials.

The answer key emphasizes the importance of comparing these two types and understanding when each applies. For instance, it explains how to compute experimental probability by dividing the number of successful trials by total trials, with examples illustrating convergence toward theoretical probability over many trials.

3. Compound and Multiple Events

This section explores the probability of combined events using:

- The multiplication rule for independent events:

\[

$$P(A \text{ and } B) = P(A) \times P(B)$$

\]

- The addition rule for mutually exclusive events:

\[

$$P(A \text{ or } B) = P(A) + P(B)$$

\]

The answer key includes problem examples with detailed reasoning, ensuring students grasp the conditions under which each rule applies.

4. Conditional Probability and Independence

Understanding how one event affects the probability of another is key. The formula for conditional probability:

\[

$$P(A|B) = \frac{P(A \text{ and } B)}{P(B)}$$

\]

The answer key demonstrates how to calculate this with real data and clarifies the concept of independence, where:

\[

$$P(A|B) = P(A)$$

\]

The solutions guide students through setting up the problem, calculating the probability, and interpreting the results.

5. Using Diagrams and Visual Aids

Tree diagrams and Venn diagrams are instrumental in solving complex probability problems. The answer key provides visual representations for various scenarios and explains how to translate these diagrams into algebraic expressions to find the required probabilities.

Sample Problems and Detailed Solutions from the Answer Key

Problem 1: Basic Probability

Question: A bag contains 5 red, 3 blue, and 2 green marbles. What is the probability of randomly selecting a blue marble?

Solution:

- Total marbles:

\[

$$5 + 3 + 2 = 10$$

\]

- Favorable outcomes (blue marbles):

\[

$$3$$

\]

- Probability:

\[

$$P(\text{blue}) = \frac{3}{10}$$

\]

Answer: $\boxed{\frac{3}{10}}$

Problem 2: Experimental Probability

Question: A student rolls a die 50 times and observes 8 sixes. What is the experimental probability of rolling a six?

Solution:

- Number of successful outcomes:

$$\{$$

8

$$\}$$

- Total trials:

$$\{$$

50

$$\}$$

- Experimental probability:

$$\{$$

$$P_{\text{exp}} = \frac{8}{50} = \frac{4}{25}$$

$$\}$$

Answer: $\boxed{\frac{4}{25}}$

Problem 3: Compound Events (Independent)

Question: What is the probability of flipping a coin and rolling a die, getting a head and a 4?

Solution:

- Probability of heads:

$$\{$$

$$P(\text{Head}) = \frac{1}{2}$$

\]

- Probability of rolling a 4:

\[

$$P(4) = \frac{1}{6}$$

\]

- Since the events are independent:

\[

$$P(\text{Head and 4}) = \frac{1}{2} \times \frac{1}{6} = \frac{1}{12}$$

\]

Answer: $\boxed{\frac{1}{12}}$

Problem 4: Conditional Probability

Question: In a class, 60% of students pass a test. Among the students who studied, 80% pass. If a student is selected at random and they passed, what is the probability they studied?

Solution:

Let:

- (S) = student studied
- (P) = student passed

Given:

\[

$$P(P) = 0.6, \quad P(P|S) = 0.8$$

\]

Assuming that all students either studied or did not study, and the remaining students didn't study:

- $P(S)$ unknown; need to find $P(S)$

Using Bayes' theorem:

\[

$$P(S|P) = \frac{P(P|S) \times P(S)}{P(P)}$$

\]

But without $P(S)$, we can assume that the proportion of students who studied is x , then:

\[

$$P(P) = P(P|S) \times P(S) + P(P|\text{not } S) \times P(\text{not } S)$$

\]

If students who did not study have a pass rate of p , then:

\[

$$0.6 = 0.8 \times P(S) + p \times (1 - P(S))$$

\]

Suppose p is unknown; the answer key guides students on how to set up and solve such problems, emphasizing the importance of additional data or assumptions.
