Core Components of Zabbix in Network Monitoring

Agents and Proxies

- Zabbix Agents: Installed directly on monitored hosts to collect detailed data such as CPU load, disk usage, and application metrics.
- Proxies: Serve as intermediaries that aggregate data from multiple agents, reducing load on the

central server and enabling monitoring across remote or segmented networks.

Zabbix Server

Acts as the central hub for data collection, processing, and alerting. It manages configurations, triggers, and notifications, orchestrating the overall monitoring ecosystem.

Data Collection and Storage

Zabbix employs various methods?such as SNMP, IPMI, JMX, and custom scripts?to gather data. Collected metrics are stored in a scalable database backend, enabling historical analysis and reporting.

Visualization and Notification

Rich dashboards, maps, and graphs facilitate data interpretation. Automated alerts via email, SMS, or integrations with messaging platforms keep stakeholders informed of issues in real time.

Deploying Zabbix for Network Monitoring: Best Practices

Planning Your Infrastructure

Before deployment, assess the network scope, device types, and expected data volume. Proper planning ensures scalability and performance.

Considerations include:

- Number of monitored devices
